

Percentages Loans and Saving

Percentages

- Percent is the number per 100
- To convert a decimal to a percent, move the decimal point two digits to the *right*
- To convert a percent to a decimal, move the decimal point two digits to the *left*

Examples % to Decimal

$$3.7\% \rightarrow 0.037$$

$$125.8\% \rightarrow 1.258$$

$$19\% \rightarrow 0.19$$

$$1.2\% \rightarrow 0.012$$

Examples: Decimal to %

$0.48 \rightarrow 48\%$

$0.031 \rightarrow 3.1\%$

$2.173 \rightarrow 217.3\%$

$0.000098 \rightarrow 0.0098\%$

More On Percents

- General formula: $100 * A/B = \%$
 - What percent of 4 is 3? $100 * 3/4 = 75\%$
 - What percent of 6 is 1? $100 * 1/6 \sim 16.667\%$
 - What percent of 7 is 1? $100 * 1/7 \sim 14.286\%$
- Pitfalls of Percentages
 - Know what the numerator is
 - Know what the denominator is

Calculating with Percentages

- Convert the percentage to a decimal
- Perform whatever calculation is needed in decimal arithmetic

Simple Interest

- Define P as the total amount of money, either in savings or borrowed
- Define r as the rate of interest per unit of time. Generally that unit is a month, or a year. Convert r into a decimal fraction.
- Define n as the number of units of time that have passed
- The amount of interest on P dollars at interest rate r held for n units of time is $P*r*n$
- \$1000 held for 16 months at 0.4% interest per month yields \$64
- \$5000 held for 15 years at 5% interest per year yields \$3750

Compound Interest

- Define P , r and n as with simple interest
- Define A as the total amount at the end of n^{th} unit of time
- $A = P*(1+r)^n$
- \$5000 at 5% per year, compounded monthly, held for 15 years
 - $P = 5000$, $r = 0.05/12 \sim 0.0041667$, $n = 12*15 = 180$
 - $A = \$5000*(1.0041667)^{180} = \$10,568.52$ (rounded off to the nearest penny)
- \$50,000 at 4.8% per year, compounded monthly, held for 25 years
 - $P=50,000$; $r = 0.048/12 = 0.004$; $n = 12*25 = 300$
 - $A=\$50,000*(1.004)^{300} = \$165,608.97$

Loans and Saving

- Set P = the payment
- Set A = the amount in question
- Set n = number of units of time
- Set r = interest per unit of time

Loans and Savings

Formula for payment

$$P = A * r / ((1+r)^n - 1) * (1+r)$$

Saving and Interest

- Say you need to have \$8,000 in 7 years and you can get 4.8% interest per year, compounded monthly.

- $A = 8000$

- $r = 0.048/12 = 0.004$

- $n = 7*12 = 84$

- $P = A*r/((1+r)^n - 1)*(1+r) = \$8000*0.004/((1.004^{84} - 1)(1.004))$
 $= 8000*0.004/((1.004^{84} - 1)*(1.004)) = 32/(1.39840148331-1(*1.004) \sim 80$

- Assume the interest rate is actually 3.6% compounded monthly

- $r = 0.036/12 = 0.003$

- $A \sim \$83.63$

Loans and Saving

You need to borrow A dollars, paying it in monthly installments, at interest rate r per unit time, paid over n payments. What will the payment be?

$$P = A * r / (1 - (1 + r)^{-n})$$

You can afford a payment of P dollars a month. The interest rate is r per unit time, and you plan to pay this over n units. What can you afford to borrow?

$$A = P * (1 - (1 + r)^{-n}) / r$$

Payment on a Loan

- Borrowing \$95,000 at 6% per annum, compounded monthly, paying back over 20 years
 - $A = \$95000$
 - $r = 0.06/12 = 0.005$
 - $n = 20 * 12 = 240$ months
 - $P = 95000 * 0.005 / ((1 - (1.005)^{-240}) \sim \680.61
 - Total of payments: \$163,336.40
- The same scenario, but at 5.4% interest
 - $r = 0.054/12 = 0.0045$
 - $P = 95000 * 0.0045 / ((1 - (1.0045)^{-240}) \sim \648.14
 - Total of 240 payments: \$155,553.60

What Can I Afford to Borrow?

- You can afford a payment of \$700 a month, at 6% interest
 - $P = 700$
 - $r = 0.06/12 = 0.005$
 - $n = 12 * 20 = 240$
 - $A = 700 * (1 - (1.005)^{-240}) / 0.005 = \$97,706.54$
- You find an interest rate of 5.4%
 - $r = 0.054/12 = 0.0045$
 - $A = 700 * (1 - (1.0045)^{-240}) / 0.0045 = \$102,601.40$
